Application No. 10/531,999  
Attorney Docket No. 072444

**AMENDMENTS TO THE ABSTRACT**

Please replace the Abstract with the following amended Abstract:

A clip which solves a technical problem that the latching of the clip is not easily released by the external force caused by falling, etc., and is easily released when the clip is used. The clip has opposed clipping arms capable of forming an independent and separate space by pressing and holding a clipped object constituted of a flexible hollow member between them. The clip has a latching means on one end of the opposed clipping arm, which has a latching part capable of latching the clipping arms. The clip further has a latching releasing means capable of releasing the latching by an external force headed to an external direction from the clipping arm. The latching means has a supporting point part acting the latching releasing force, added to the latching means by the latching releasing means, to the direction to release the latching of the latching part.
